POSITION PAPER

United Nations General Assembly (UNGA)

Country: People's Republic of China

Agenda: Strengthening Global Actions and International Cooperation to Combat Climate Change

I. Country Position and Overview

The People's Republic of China recognizes climate change as one of the most serious global challenges of the 21st century. Rising temperatures, extreme weather events, melting glaciers, rising sea levels, and environmental degradation threaten the sustainable development of nations worldwide. China believes that addressing this challenge requires collective international action, mutual cooperation, and a commitment to sustainable development.

China maintains that developed and developing countries have different historical responsibilities, capabilities, and development needs. Therefore, the principle of **Common but Differentiated Responsibilities and Respective Capabilities (CBDR-RC)** must remain central to international climate negotiations. Developed countries should fulfil their commitments by providing adequate climate finance, technology transfer, and capacity-building support to developing nations.

II. Past Involvement of the People's Republic of China

China has participated in international climate efforts for several decades. It signed the United Nations Framework Convention on Climate Change (UNFCCC) in 1992 and ratified it in 1993. China signed the Kyoto Protocol in 1998 and ratified it in 2002, becoming part of the international framework for addressing greenhouse-gas emissions.

China also took part in the negotiations that led to the 2015 Paris Agreement. It signed the agreement in April 2016 and formally ratified it in September 2016. Through its participation in these agreements and subsequent climate negotiations, China has supported multilateral approaches to climate action while emphasizing equity and the different circumstances of developing countries.

China has also promoted climate cooperation with developing countries through its South-South Cooperation on Climate Change. In 2015, it announced an initiative involving 10 low-carbon demonstration zones, 100 climate mitigation and adaptation projects, and training for 1,000 climate-related professionals from developing countries. These efforts reflect China's stated commitment to sharing experience, supporting capacity-building, and expanding practical cooperation.

Domestically, China has invested substantially in renewable energy, including solar and wind power, and has announced goals to peak carbon dioxide emissions before 2030 and achieve carbon neutrality before 2060. China has also submitted successive climate commitments under the Paris Agreement, including an enhanced 2035 target.

III. Current Challenges

Despite progress, significant obstacles continue to limit global climate action. Many developing countries lack the financial resources, infrastructure, and access to advanced technologies needed to reduce emissions and adapt to climate impacts. Unequal access to climate finance, gaps in technology transfer, and differing national circumstances can weaken international efforts. China considers it essential that climate policies remain fair, practical, and supportive of sustainable development and poverty reduction.

IV. Proposed Solutions and Recommendations

1. **Strengthening international cooperation:** Encourage stronger partnerships through the United Nations and other multilateral platforms, enabling countries to coordinate climate policies, share scientific knowledge, and exchange effective environmental practices.
2. **Climate finance:** Urge developed countries to honour their climate-finance commitments and make funding more accessible to developing nations for mitigation, adaptation, and climate-resilient development.
3. **Technology transfer:** Promote fair, affordable, and practical access to renewable-energy technologies, energy storage, and climate-resilient infrastructure, alongside technical training and capacity-building.
4. **Renewable energy development:** Encourage investment in clean-energy infrastructure and support countries in pursuing energy transitions in accordance with their national circumstances and development priorities.
5. **Climate adaptation and disaster preparedness:** Expand cooperation on early-warning systems, disaster-risk reduction, emergency preparedness, and resilient infrastructure, particularly for climate-vulnerable communities.
6. **Sustainable development and capacity-building:** Support education, scientific research, and technical training so that developing countries can design and implement effective long-term climate policies.

V. Conclusion

The People's Republic of China firmly believes that climate change cannot be addressed through the efforts of individual nations alone. A fair, inclusive, and cooperative international approach is essential to achieving meaningful progress. China calls upon all Member States to strengthen their commitments, respect national circumstances, uphold the principle of Common but Differentiated Responsibilities and Respective Capabilities, and work collectively towards a sustainable and climate-resilient future for present and future generations.
