POSITION PAPER
Committee: United Nations General Assembly (UNGA)
Country: United States of America
Topic: Strengthening International Cooperation And Environmental Strategies
Delegate's Name: Muhammad Siddique Jamali

Global warming poses significant harm to ecological systems, people's health, and economies worldwide. The issue arises from human activities, such as the burning of fossil fuels, transportation, industrialization, and deforestation, resulting in an increase in greenhouse gas emissions. In order to tackle this global issue, there is need for countries to cut their emissions, collaborate, and help communities cope with climate related dangers (UNFCCC, n.d.).

The United States is aware of the fact that it has contributed greatly to the accumulation of greenhouse gases in the atmosphere, and understands that big emitters have to take appropriate steps. The United States has also promoted clean energy development through its actions like inflation reduction act and energy infrastructure projects. The delegation believes in climate action with both domestic and international approaches.

Responsibility of climate change needs to be handled with the spirit of cooperation, openness, and fairness. There is a difference in responsibility and capacity of various nations under the UNFCCC. While China and India are among the developing nations or non-Annex | Parties under UNFCCC, they are also two major economies contributing to emissions. So, the US encourages major emitters to make an effort for climate change according to their emissions and capacity. Vulnerable developing countries must be supported more without making these efforts dependent only upon a few nations.
Major emitters as well as other capable nations must commit themselves to contribution to international programs. Contributions must be made according to the capacity and emissions of countries, which need to be monitored and reported publicly.

Work together to encourage industry and government to cooperate on sharing the burden of investments in cleaner technologies, more energy-efficient equipment, and the modernization of industrial infrastructure.

Encourage nations to establish transparent standards for emissions-intensive products like steel, aluminum, cement, and chemicals. Any policies at borders must be based on verifiable data and not introduce any undue trade barriers.
Strengthen cooperation on renewable energy, energy storage, and smart power grids. Exchange technology and technical expertise so that developing nations are able to use renewable energy that is affordable.
Make funding accessible for adaptation, disaster readiness, and recovery. The funding must be transparent and go to those areas of the world most at risk.
Help to create better reporting and verification of greenhouse gas emissions. Good data helps build trust and monitor progress and shows which areas need more effort.
