Position Paper

Committee: United Nations of General Assembly
Country : Arab Republic of Egypt
Topic : Strengthening Global Action and International Cooperation to Combat Climate Change.
Delegate's Name: Sajda Panhwar

The Arab Republic of Egypt affirms that climate change presents major risks to economies, ecosystems, food security, and human life. Climate change results in increasing temperature, rising sea levels, desertification, droughts, and extreme weather events. Developing countries present themselves to be particularly vulnerable to climate change because they have emitted less than 5% of the world's historical greenhouse gases.

Being a desert nation with 95% of its people living near the Nile, Egypt encounters extreme difficulties due to climate change. This involves issues such as water scarcity, desertification, extreme temperatures, and rising sea levels that impact the Nile Delta. Being a country that depends on the Nile River (97%) for water security, Egypt requires the resilience of its agricultural sector. According to the Sixth Assessment Report by the IPCC, the Nile Delta is one of the top three most vulnerable Deltas in the world with 2 million of its citizens being displaced.

Egypt has been the leader in climate change issues. It hosted the Presidency of COP27 in Sharm El-Sheikh in 2022 and made a historic achievement by securing an agreement to establish Loss and Damage Fund. Egypt has also acted nationally through developing the National Climate Change Strategy 2050 and updating their Nationally Determined Contributions (NDC). In this process, Egypt has set the target of generating 42% of electricity from renewable energy by 2030.
They have developed the Benban Solar Park (1.8GW), which is the fourth-largest in the world, the Suez Canal Economic Zone Green Hydrogen Hub and the flagship project Nexus of Water, Food and Energy (NWFE), to raise the $14.7 billion for nine key adaptation and mitigation projects

Climate action in Egypt will be built according to the Common But Differentiated Responsibilities and Respective Capabilities (CBDR-RC) principle of UNFCCC and Paris Agreement. We call upon developed countries to provide the promised $100 billion, to take advantage of the Loss and Damage Fund through grants instead of loans and to make sure that half of the financing is allocated for adaptation projects. Egypt is in favor of debt swaps for climate, better technology transfer under article 10 of the Paris Agreement and more reliance on early warning systems, water saving techniques, coastal protection, and climate-smart agriculture. Egypt will not accept any framework for climate change action that obliges developing countries to reduce greenhouse gas emissions without finance, technology, and capacity building.
