United Nations General Assembly (UNGA)

Strengthen Global Actions And International Cooperation To Combat Climate Change

Climate Change refers to long term changes in Earth's temperature, and weather patterns;

Climate Change happens when fossil fuels are burnt and deforestation happens which cause increase in green house gases and increase Earth's temperature which affects whole world through disasters like floods, heatwaves, droughts, and many more; this issue is important to Russia as it affect Russia through wildfires and damage to infrastructure.

Russia believes that climate change is a serious problem; Russia has set a carbon neutrality goal by 2060, and Russia has set to reduce green house gas emissions by 33-35 by 2035 to it's 1990 level;

Russia faces several environmental, economic, and infrastructure problem form climate change through heat waves and wild fires.

Russia supports solutions such as saving trees and stop unnecessary deforestation; countries should use renewable energy such as solar,wind, and hydro power and stop only depending on fossil fuels for energy, and all countries should work together and stop just blaming on each other;

United Nations (UN) should make international agreements to reduce climate change such as Paris agreement and countries can also cooperate with each other through international treaties.
